Road Map

1. MENA: A tenuous and uneven economic recovery in 2021
2. Long-term socio-economic trends left MENA with over-burdened public health systems
 - Fiscal myopia
 - High fertility rates
 - Epidemiological trends
3. Ill-prepared and overconfident
4. Overwhelmed health systems during Covid-19
5. Data transparency and policy recommendations

A tenuous and uneven economic recovery in 2021

A. GDP Forecast for MENA

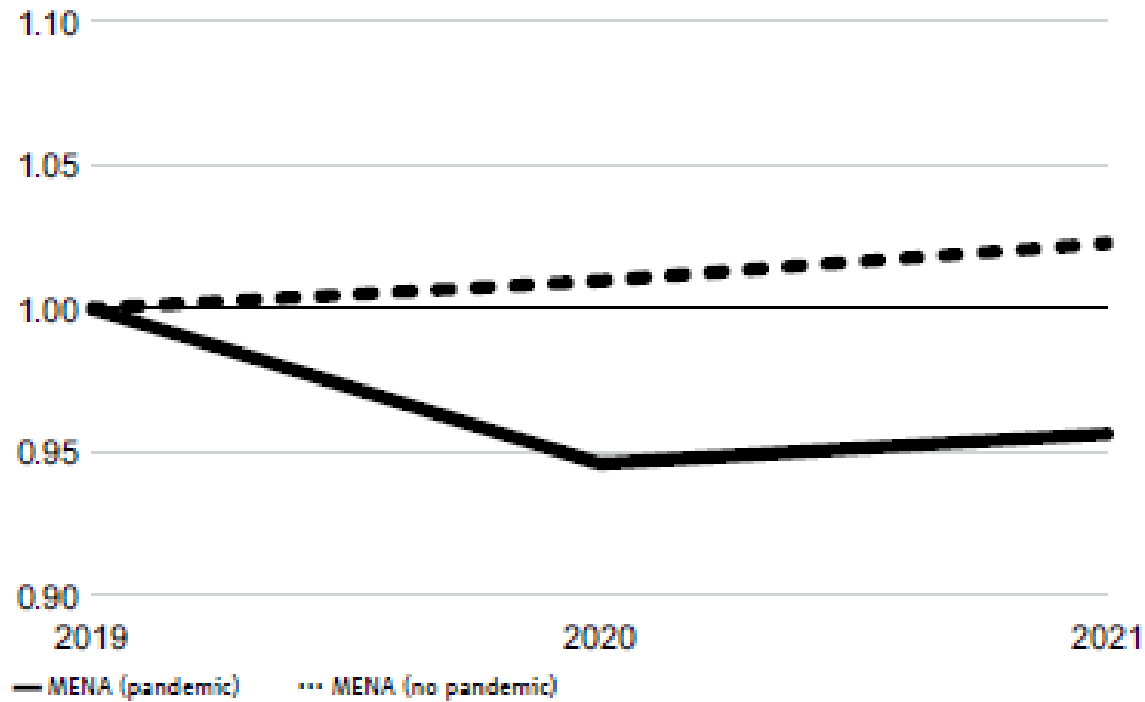

B. GDP Forecast for MENA Country Groups

- MENA’s GDP contracted 3.8 percent in 2020 and is forecast to grow by 2.8 percent in 2021.
- The output cost of the Covid-19 crisis thus far in MENA is almost \$200 billion dollars, a number derived by comparing the region’s forecast GDP level with that of the no-pandemic scenario.

A tenuous and uneven economic recovery in 2021

C. GDP per Capita Forecast for MENA

D. GDP per Capita Forecast for MENA Country Groups

- GDP per capita is a more precise measure of standard of living.
- Growth in GDP per capita is low: 1.1% in 2021. GDP per capita will be well below pre-covid levels by the end of 2021.

Public Health Surveillance Helps Growth

Figure 2.3. Growth Adjustments and Positivity Rate

Source: Authors' calculation.

Note: The scatter plot shows the partial correlation between growth adjustment in 2020 and positivity rate,

Fiscal myopia associated with lack of economic reforms

The only region with a substantial increase in government expenditure during 2009-2019

Figure 3.1. Government Expenditure in Total GDP in 2009 and 2019

Source: World Bank, World Development Indicators.
 Note: based on data from 160 countries whose data are available. Data from 2017 and 2018 are used when 2019 data is not available.

Spending on health is overshadowed by a large public sector wage bill

Figure 3.4. Public Health Expenditures over Public Sector Wage Bills versus GDP per Capita, 2018

Sources: World Health Organization, *Global Health Expenditures* database (government health expenditure), International Monetary Fund (GDP, public compensation expenditure), World Bank (PPP), World Bank staff calculations.
 Note: Linear trendline shown. Country data years: 2018 or later (UAE, Saudi Arabia, Jordan), 2015 (Egypt), 2012 (Tunisia, Yemen), 2011 (Morocco).

- Public health was under-funded relative to the global norm by an average of 16 percent.
- The share of out-of-pocket expenditures is 60% in Egypt and 80% in Yemen, and only 6% in Oman. This reflects the advantages of the well-funded health systems in the GCC.

Under-funded Core Health Items

Figure 3.5. Spending on Preventive Health and Health System Functions

A. Preventive Health in Government Spending vs GDP per Capita

Government preventive health care expenditure as percent of general government expenditure

B. Health System Expenditure in Government Spending vs GDP per Capita

Government administrative health care expenditure as percent of general government expenditure

Source: WHO GHE Database (Government Preventive Health Care Expenditure, Government Health Care Expenditure on Governance, Health System and Financing Administration); World Bank, *World Development Indicators* (GDP per capita, PPP), World Bank staff calculations.

Note: Observations are from 65 countries. Data are as of 2018.

High Out-of-pocket Spending in Many MENA Countries

Figure 5.2. Sources of Health Spending as a Share of Total Health Spending

Source: World Health Organization, *Global Health Expenditure Database*.
 Note: Data from 2018, except: Libya, 2011; Syria, 2012; and Tunisia, 2015.

High Fertility Rates in Many MENA Countries

Figure 4.1. Fertility Rates versus Gross National Income per Capita

Sources: United Nations, *World Population Prospects*; World Bank, *World Development Indicators*, World Bank staff calculations.

Note: Linear trendline shown.

- Iraq and Oman have abnormally high fertility rate compared to income peers.
- High young-age dependency ratio could hurt women's health and hamper investment per capita in children's health and education.

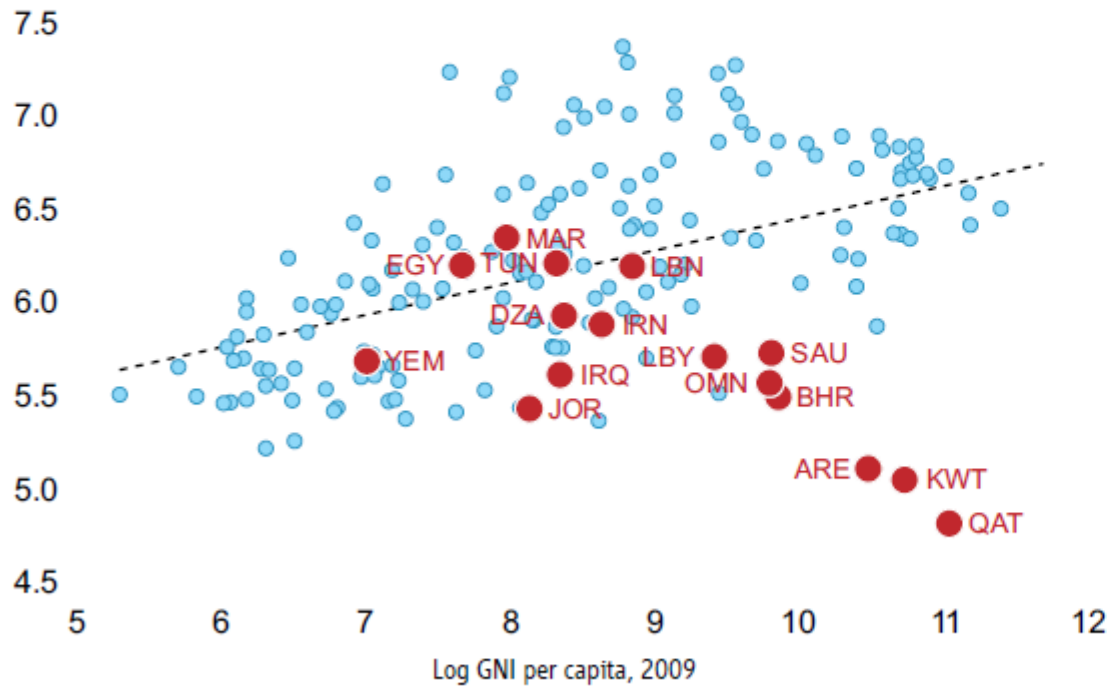

A young population created the illusion of a healthy population

Figure 4.4. The Illusion of Healthy Populations when Age Demographics Differ across Countries

Deaths per Capita due to Non-Communicable Diseases

A. Without age adjustment

Log NCD deaths/100k population, 2019

B. With age adjustment

Log NCD deaths/100k population, 2019

Sources: World Health Organization, *Global Health Observatory*; World Bank, *World Development Indicators*.
 Note: Age adjustment calculations conducted by World Health Organization. Linear trendline shown.

Ill-prepared and overconfident health systems prior to Covid-19

Table 5.1. Overconfident MENA: Public Health System Preparedness versus Self-Assessments

Policy Implications: Data transparency for public health is beneficial

- Overhauling data systems as part of health system reforms is an urgent area for action for the MENA region.
- High-quality, reliable, and timely data that can be linked across databases and across time is needed to generate tremendous benefits for health systems in general and for a country's pandemic response in particular.

Public Health Data in MENA Are Lacking

Figure 7.1. Data Availability Assessment for MENA

A. Availability of Indicators by Country

Number of fields per availability status

Public Health Data in MENA Are Lacking

B. Availability across Countries for Each Indicator

Note: The fields in Panel B are key to a better understanding of the spread, severity and impact of Covid-19 in countries and can be used to conduct comparisons. This assessment aims to determine the status of collection and public availability of these fields per country in the MENA region. Data is either collected and publicly available, collected and not publicly available, or not collected/collection status. Panel A lists the availability/status of nine fields for each country. Panel B lists the availability status for each field by country.

In Summary

- MENA countries were **overconfident about preparedness of their public health systems**
- **Three long-term trends undermined growth & made MENA ill-prepared** for health system shocks
 - Economic
 - Demographic
 - Epidemiological
- **Covid as stress test**
- **Policy implications:** Improved availability/use of data → Facilitate appropriate planning & preparedness for regular/emergency health care.
